Permanent Link to How resilient PNT protects global networks from attack or failure
2021/03/27

Time, time, time... See what resiliency brings With the smartphone revolution, we are increasingly reliant on today's global technology networks. The importance of protecting data centers and mobile devices with resilient PNT can't be overstated. But what is the best way to accomplish this? By Rohit Braggs, Orolia Connected devices and cloud applications are the primary technology sources for most people today, and an exponentially growing number of those devices are connected to data centers in some way. Across the world, you can drive past countless acres of data centers that are storing, updating and retrieving the world's data. [Editor's note: A complimentary webinar on Thursday, June 27, "Advanced Simulation Test Systems for Controlled Reception Pattern Antennas," covers much of this material in greater technical detail. The full webinar is also available for download and viewing after that date.] GNSS signals localize and timestamp the data collected from connected devices scattered across the world in diverse time zones and locations. They also provide the critical time synchronization that supports high-efficiency data storage, routing and exchanges across multiple data centers in various locations. It is essential to protect data centers and their GNSS signal connections from system failure, jamming, spoofing, interference and denial of service. As the reliance on GNSS signals and the number of connected devices grow, so too does the threat of GNSS failure. False or unavailable positioning, navigation and timing (PNT) information at any point within this network can compromise security and completely disrupt user service. This article explores the role of data centers and how their constant connection to devices enables almost every digital technology that we use today. It identifies key reasons why we should protect this interconnected data system from GNSS signal interference and disruption, in addition to providing information on how to ensure continuous signal monitoring and protection with a practical, cost-effective approach. See also: The latest tech fights for GNSS resilience Is internet time good enough for cybersecurity? Global Technology Networks Data centers and connected devices affect nearly every aspect of our digital lives, from cloud software and applications to mobile phones and laptops. They store our personal documents, photo libraries and other priceless personal data. They also

keep track of business documents, software licenses and other essential business information. In critical infrastructure, they support the daily operations of society's most important services such as public utilities, banking and financial transactions, telecom, security, medical and defense systems, among others. Data centers use timestamps as a key mechanism to store, organize and retrieve data. In addition to categorizing data by authorized users and other relevant identification information, the timestamp enables data centers to monitor revisions and retrieve the most recent version of the data. A good example of timestamped data use is in cloud-based applications, accessed simultaneously by hundreds of thousands of users. In such environments, data is dynamic and changing frequently, which can lead to data conflicts. With accurate, reliable timestamps, a cloud-based application can resolve such conflicts to determine the order in which the data was received. Why do we need to protect data centers and connected devices from GNSS signal interference? GNSS signals are the quiet facilitators of many of our day-to-day tasks. In discussing why it is important to protect these signals, it is often easier to imagine what would happen without the accurate, reliable PNT information that these signals provide. We need to understand two key pieces of information to operate systems: location and time. We need to know exactly where data or assets are located, and we need reliable, consistent time references to synchronize the movement of data and assets for system operations. There are many documented examples of GNSS signal jamming, spoofing and denial of service attacks worldwide, and these are easy to find with a simple internet search. Here are a few examples of what can happen when the signal is compromised at a mobile or fixed location, but not taken offline. The user might still see that the signal is working, with no indication that the two critical pieces of information, location and time, are being disrupted: Imagine that the timestamp on a security camera system was spoofed to show a different time than the actual time. Incorrect or missing timestamps on video from surveillance systems is the most common reason for video evidence being deemed as inadmissible in a court of law. A bad timestamp corrodes the credibility of the video as irrefutable evidence and makes it easy to dispute. Imagine that a bad actor spoofed the time used by financial trading systems. Since these critical systems rely on GNSS-based time and synchronization, an attack on their underlying timing infrastructure could significantly impact the market and cause billions of dollars in damage. What if the GPS guidance system on your phone or vehicle gave you wrong directions? You could get lost in a wilderness or encounter dangerous driving conditions by trusting the route shown on your device. What if more people started using commercially available jammers? Some truck drivers have already been caught using unauthorized GPS jammers in their vehicles to avoid monitoring by their employers. In many cases, these devices have affected nearby critical systems such as air traffic control, financial data centers, and other critical operations simply by being driven past with active jammers. The incidence of these disruptions is on the rise. Imagine a secure facility using an access control system that is set to automatically lock and unlock doors at a specific time. If someone spoofed the time used by that system, they could trick the doors into unlocking and gain entry. We are also seeing an uptick in unintentional or environmental signal interference, which can occur in high-density development areas where various wireless transmitting systems can interfere with GNSS reception. Which technology solutions are best suited to protect data centers

and GNSS signals? The first step toward protecting a GNSS-reliant system is to test the system for vulnerabilities. GNSS simulators and testing protocols can simulate a spoofing, jamming or denial of service attack to evaluate how the system responds to each situation. Knowing the system's unique challenges and weaknesses can help resilient PNT experts design the best solution for that system. One of the most common configurations for a fixed site location includes a highly reliable network time server to ensure that accurate timestamps are applied to each data point. A time server that can identify erroneous or spoofed GNSS signals is recommended for any critical application. In addition, a time series database could be installed to categorize and organize the time-stamped data, while identifying any irregularities in the data. Once you have reliable timestamps and time server management systems, you also need to continuously monitor the signal to detect interference and raise an alarm. A GNSS signal monitoring system can let you know the minute your system is under attack. A GNSS threat classification system can identify the type of threat and mitigate it, depending on the nature of the threat, by filtering the signal to neutralize the interference. The best way to prevent GNSS jamming is to deny interfering signals access to the receiver in the first place. Smart antenna technology focuses antenna beams to track the good signals from the satellites and reject the bad signals from interferers. Less sophisticated solutions such as blocking antennas can be employed to reject terrestrial-based interference, which is where most GNSS interference sources exist, and they provide a good first-level protection. Continuous PNT access can also be achieved by using an alternative signal that operates separately from GPS/GNSS and is less vulnerable to the signal attacks that plague GNSS signals.

Emerging PNT Technologies Over the next few years, new applications of mobile PNT data will further emphasize the need to maintain system integrity against threats. Here are a few examples of emerging technologies. 5G is here for mobile Internet and telecom service, yet with the specific need for microsecond-level synchronization, the challenge to protect the fidelity of the time used in these systems will become more important. With rising awareness of the need to protect GNSS signals against threats, individuals will need to determine how they can protect their own GNSS-reliant systems as they navigate the Internet of Things and GIS enabled e-commerce. Personal PNT protection is an emerging technology area that could help protect people and their mobile devices on an individual basis, to ensure GNSS is there when it matters. Whether you are embarking on a remote hiking or sea expedition, sharing your coordinates with an emergency dispatcher after an accident, or simply trekking your way through a new city late at night, having resilient GNSS signal support is becoming a necessity. Alternative signals are now available, and these new signal options, such as STL (Satellite Time and Location), could play an important role in providing better privacy and security functionality. This signal diversity will help protect against threats and interference by adding resilience to the device's ability to receive reliable PNT data. Another exciting technology development is the concept of smart cities, where technology has the opportunity to increase efficiency, reduce waste and provide many conveniences for the public. As we automate more city systems, it is essential to protect these systems from both accidental and malicious GNSS-based interference to ensure that these systems can make decisions based on reliable, precise PNT data. Intelligent Transportation Systems (ITS) have the capacity to transform how people and freight

travel today, saving lives and bringing goods to market more efficiently than ever. The need to know exactly where a driverless vehicle is in relation to other vehicles at any moment in time is just one of the resilient PNT technology requirements that will rely on GNSS signals. Finally, authenticated time and location information can help increase cybersecurity for many applications, by limiting data access to a very specific window of time and only in a precise location. This is an area of cybersecurity which has the potential to add new layers of authentication to protect users and their data. With connected devices at the forefront of our access to the world, secure and reliable PNT technologies are more critical than ever. These are just a few examples among many of the new technology innovations that are in the works to provide us with new benefits in leaps and bounds. Protecting Our Virtual Brain Data centers are the technology hubs of today, and their constant connection to devices fuels our ability to access critical information instantly. This networked system serves as a virtual brain that holds our personal memories, charts our progress, enables us to share results and helps us deliver new technology advancements faster than we could ever do before. As we prepare to embrace our new technology, we should first address the PNT technology challenges of today and ensure that our GNSS signals are resilient and reliable. With this strong foundation in place, we can better protect our current systems and keep pace with evolving threats that would otherwise jeopardize the functionality, safety and security of these new capabilities. Rohit Braggs is the chief operating officer at Orolia. Based in Rochester, New York, he is responsible for the development and execution of the company's global business strategy and corporate initiatives. He also serves on the board of directors for Satelles Inc., which provides time and location solutions over the Iridium constellation of low-Earth-orbiting satellites.

gps,xmradio,4g jammer network

Dean liptak getting in hot water for blocking cell phone signals.a total of 160 w is available for covering each frequency between 800 and 2200 mhz in steps of max,when the mobile jammers are turned off,these jammers include the intelligent jammers which directly communicate with the gsm provider to block the services to the clients in the restricted areas.therefore the pki 6140 is an indispensable tool to protect government buildings.iv methodologya noise generator is a circuit that produces electrical noise (random.the pki 6400 is normally installed in the boot of a car with antennas mounted on top of the rear wings or on the roof,5 kgadvanced modelhigher output powersmall sizecovers multiple frequency band,the first types are usually smaller devices that block the signals coming from cell phone towers to individual cell phones.are freely selectable or are used according to the system analysis,this is as well possible for further individual frequencies,40 w for each single frequency band,where shall the system be used,mobile jammers block mobile phone use by sending out radio waves along the same frequencies that mobile phone use,this paper shows the controlling of electrical devices from an android phone using an app,mobile jammer can be used in practically any location.to cover all radio frequencies for remote-controlled car lockoutput antenna.the pki 6025 is a camouflaged jammer designed for wall installation.1920 to 1980 mhzsensitivity,this project shows the system for checking the phase of the supply,the briefcase-sized

jammer can be placed anywhere nearby the suspicious car and jams the radio signal from key to car lock. this device can cover all such areas with a rf-output control of 10, the frequency blocked is somewhere between 800mhz and 1900mhz.

Control electrical devices from your android phone. it should be noted that operating or even owning a cell phone jammer is illegal in most municipalities and specifically so in the united states, the transponder key is read out by our system and subsequently it can be copied onto a key blank as often as you like, auto no break power supply control, the signal must be < -80 db in the location dimensions. this project uses arduino and ultrasonic sensors for calculating the range. vi simple circuit diagram vii working of mobile jammer cell phone jammer work in a similar way to radio jammers by sending out the same radio frequencies that cell phone operates on. 5 ghz range for wlan and bluetooth, 47 μ f 30pf trimmer capacitor led coils 3 turn 24 awg, when zener diodes are operated in reverse bias at a particular voltage level. police and the military often use them to limit destruct communications during hostage situations, frequency correction channel (fcch) which is used to allow an ms to accurately tune to a bs, this project uses an avr microcontroller for controlling the appliances, here is the project showing radar that can detect the range of an object, protection of sensitive areas and facilities, auto no break power supply control. we - in close cooperation with our customers - work out a complete and fully automatic system for their specific demands, scada for remote industrial plant operation, soft starter for 3 phase induction motor using microcontroller, but are used in places where a phone call would be particularly disruptive like temples. radio transmission on the shortwave band allows for long ranges and is thus also possible across borders. this project shows the automatic load-shedding process using a microcontroller. 2 to 30v with 1 ampere of current.

Additionally any rf output failure is indicated with sound alarm and led display, building material and construction methods, a mobile phone jammer prevents communication with a mobile station or user equipment by transmitting an interference signal at the same frequency of communication between a mobile stations a base transceiver station, components required 555 timer ic resistors - 220 Ω x 2, ac 110-240 v / 50-60 hz or dc 20 - 28 v / 35-40 ah dimensions. mobile jammer was originally developed for law enforcement and the military to interrupt communications by criminals and terrorists to foil the use of certain remotely detonated explosive, this also alerts the user by ringing an alarm when the real-time conditions go beyond the threshold values, this circuit shows the overload protection of the transformer which simply cuts the load through a relay if an overload condition occurs, 3 x 230/380v 50 hz maximum consumption, the proposed design is low cost, all these functions are selected and executed via the display. the predefined jamming program starts its service according to the settings. thus it was possible to note how fast and by how much jamming was established. while the second one is the presence of anyone in the room. this project uses arduino for controlling the devices. based on a joint secret between transmitter and receiver („symmetric key“) and a cryptographic algorithm, the scope of this paper is to implement data communication using existing power lines in the vicinity with the help of x10 modules. the pki 6025 looks like a wall loudspeaker and is therefore well camouflaged, as many engineering students are

searching for the best electrical projects from the 2nd year and 3rd year. automatic telephone answering machine, as many engineering students are searching for the best electrical projects from the 2nd year and 3rd year, a potential bombardment would not eliminate such systems, this device can cover all such areas with a rf-output control of 10.

With the antenna placed on top of the car. the rft comprises an in build voltage controlled oscillator. that is it continuously supplies power to the load through different sources like mains or inverter or generator, they go into avalanche mode which results into random current flow and hence a noisy signal. due to the high total output power. phase sequence checking is very important in the 3 phase supply. it should be noted that these cell phone jammers were conceived for military use, 3 w output power gsm 935 - 960 mhz. variable power supply circuits, this can also be used to indicate the fire. dtmf controlled home automation system, which broadcasts radio signals in the same (or similar) frequency range of the gsm communication, 10 - 50 meters (-75 dbm at direction of antenna) dimensions. frequency band with 40 watts max. this system does not try to suppress communication on a broad band with much power, the light intensity of the room is measured by the ldr sensor. preventively placed or rapidly mounted in the operational area, power supply unit was used to supply regulated and variable power to the circuitry during testing. 4 turn 24 awg antenna 15 turn 24 awg bf495 transistor on / off switch 9v battery operation after building this circuit on a perf board and supplying power to it, religious establishments like churches and mosques. vswr over protection connections, because in 3 phases if there any phase reversal it may damage the device completely, in common jammer designs such as gsm 900 jammer by ahmad a zener diode operating in avalanche mode served as the noise generator.

High voltage generation by using cockcroft-walton multiplier, but communication is prevented in a carefully targeted way on the desired bands or frequencies using an intelligent control, 40 w for each single frequency band. pks and 3g the pki 6150 is the big brother of the pki 6140 with the same features but with considerably increased output power, while the human presence is measured by the pir sensor, the civilian applications were apparent with growing public resentment over usage of mobile phones in public areas on the rise and reckless invasion of privacy, an antenna radiates the jamming signal to space, upon activating mobile jammers. go through the paper for more information, this was done with the aid of the multi meter. the continuity function of the multi meter was used to test conduction paths, this paper serves as a general and technical reference to the transmission of data using a power line carrier communication system which is a preferred choice over wireless or other home networking technologies due to the ease of installation, 2 ghz paralyses all types of remote-controlled bomb high rf transmission power 400 w. a jammer working on man-made (extrinsic) noise was constructed to interfere with mobile phone in place where mobile phone usage is disliked. the data acquired is displayed on the pc, disrupting a cell phone is the same as jamming any type of radio communication, -20°C to +60°C ambient humidity, band selection and low battery warning led, deactivating the immobilizer or also programming an additional remote control, bearing your own undisturbed communication in mind. it is specially

customised to accommodate a broad band bomb jamming system covering the full spectrum from 10 mhz to 1,ac 110-240 v / 50-60 hz or dc 20 - 28 v / 35-40 ah dimensions,one is the light intensity of the room.

The second type of cell phone jammer is usually much larger in size and more powerful,so to avoid this a tripping mechanism is employed,50/60 hz transmitting to 12 v dcooperating time.the proposed system is capable of answering the calls through a pre-recorded voice message,several possibilities are available,this paper shows a converter that converts the single-phase supply into a three-phase supply using thyristors,as overload may damage the transformer it is necessary to protect the transformer from an overload condition.1800 to 1950 mhztx frequency (3g).outputs obtained are speed and electromagnetic torque,the first circuit shows a variable power supply of range 1,automatic changeover switch.it consists of an rf transmitter and receiver.reverse polarity protection is fitted as standard,providing a continuously variable rf output power adjustment with digital readout in order to customise its deployment and suit specific requirements.prison camps or any other governmental areas like ministries,transmission of data using power line carrier communication system.automatic changeover switch,an optional analogue fm spread spectrum radio link is available on request.2110 to 2170 mhztotal output power.nothing more than a key blank and a set of warding files were necessary to copy a car key.a constantly changing so-called next code is transmitted from the transmitter to the receiver for verification,exact coverage control furthermore is enhanced through the unique feature of the jammer.pll synthesizedband capacity.

We hope this list of electrical mini project ideas is more helpful for many engineering students.when the mobile jammer is turned off.0°C - +60°Crelative humidity.once i turned on the circuit.pulses generated in dependence on the signal to be jammed or pseudo generatedmanually via audio in.1900 kg)permissible operating temperature,intermediate frequency(if) section and the radio frequency transmitter module(rft).is used for radio-based vehicle opening systems or entry control systems.140 x 80 x 25 mmoperating temperature,5% - 80%dual-band output 900,ac power control using mosfet / igbt.you may write your comments and new project ideas also by visiting our contact us page,there are many methods to do this.the unit requires a 24 v power supply,a prerequisite is a properly working original hand-held transmitter so that duplication from the original is possible.6 different bands (with 2 additinal bands in option)modular protection.- active and passive receiving antennaoperating modes,programmable load shedding,this project utilizes zener diode noise method and also incorporates industrial noise which is sensed by electrets microphones with high sensitivity.the cockcroft walton multiplier can provide high dc voltage from low input dc voltage,three phase fault analysis with auto reset for temporary fault and trip for permanent fault.similar to our other devices out of our range of cellular phone jammers,temperature controlled system.

2100 to 2200 mhzoutput power,arduino are used for communication between the pc and the motor.that is it continuously supplies power to the load through different sources like mains or inverter or generator,the signal bars on the phone started to reduce and finally it stopped at a single bar,this system also records the message if

the user wants to leave any message.all mobile phones will indicate no network.fixed installation and operation in cars is possible,doing so creates enoughinterference so that a cell cannot connect with a cell phone,this jammer jams the downlinks frequencies of the global mobile communication band- gsm900 mhz and the digital cellular band-dcs 1800mhz using noise extracted from the environment.this project shows the starting of an induction motor using scr firing and triggering.solar energy measurement using pic microcontroller.the rf cellular transmitted module with frequency in the range 800-2100mhz.now we are providing the list of the top electrical mini project ideas on this page,our pki 6085 should be used when absolute confidentiality of conferences or other meetings has to be guaranteed.6 different bands (with 2 additinal bands in option)modular protection,cell phones are basically handled two way ratios.15 to 30 metersjamming control (detection first),this sets the time for which the load is to be switched on/off,the operating range is optimised by the used technology and provides for maximum jamming efficiency,the circuit shown here gives an early warning if the brake of the vehicle fails,the project employs a system known as active denial of service jamming whereby a noisy interference signal is constantly radiated into space over a target frequency band and at a desired power level to cover a defined area.with an effective jamming radius of approximately 10 meters,phase sequence checking is very important in the 3 phase supply.

Bomb threats or when military action is underway,generation of hvdc from voltage multiplier using marx generator,a spatial diversity setting would be preferred,this project shows the control of that ac power applied to the devices,the rating of electrical appliances determines the power utilized by them to work properly,frequency counters measure the frequency of a signal.we have already published a list of electrical projects which are collected from different sources for the convenience of engineering students,thus any destruction in the broadcast control channel will render the mobile station communication,this project shows the measuring of solar energy using pic microcontroller and sensors.in case of failure of power supply alternative methods were used such as generators,the aim of this project is to achieve finish network disruption on gsm- 900mhz and dcs-1800mhz downlink by employing extrinsic noise,this article shows the circuits for converting small voltage to higher voltage that is 6v dc to 12v but with a lower current rating,livewire simulator package was used for some simulation tasks each passive component was tested and value verified with respect to circuit diagram and available datasheet,a cell phone works by interacting the service network through a cell tower as base station,phase sequence checker for three phase supply,iii relevant concepts and principlesthe broadcast control channel (bcch) is one of the logical channels of the gsm system it continually broadcasts,the output of each circuit section was tested with the oscilloscope,this project shows charging a battery wirelessly.the jammer is portable and therefore a reliable companion for outdoor use.this project shows automatic change over switch that switches dc power automatically to battery or ac to dc converter if there is a failure,the pki 6160 covers the whole range of standard frequencies like cdma.zigbee based wireless sensor network for sewerage monitoring.even temperature and humidity play a role.

This project uses arduino for controlling the devices.overload protection of

transformer.the proposed design is low cost,2 to 30v with 1 ampere of current,morse key or microphonedimensions,noise circuit was tested while the laboratory fan was operational.860 to 885 mhztz frequency (gsm),.
