Permanent Link to Spectracom, Satellites sync in multiple indoor locations
2021/03/23

Orolia has synchronized a Spectracom SecureSync high-precision time server with the new Iridium Satellites Satellite Time & Location (STL) time synchronization signal powered by Iridium satellites in several indoor environments in the field. Configured with an embedded STL receiver and a small patch antenna, the SecureSync synchronized with the STL signal in several challenging indoor locations. Indoor success can be attributed in part to use of a low-Earth orbit satellite-based signal 1,000 times stronger than GPS. The first successful synchronization was in the interior of a building in one of the most challenging urban canyons on Earth: downtown Manhattan on the 7th floor of the New York Stock Exchange. The second was in the interior of a conference center with multiple sources of potential signal interference during The Institute of Navigation event in Monterey, California. Additional successful indoor timing signal synchronization locations include MiFiD2 events near the Paris Stock Exchange, a multi-story building and inside Gibson Hall in downtown London. More GNSS challenged locations to come, the two companies promise. Other satellite signals — notably GNSS — have limitations indoors. The Satellites STL signal uses the narrow-band paging channels of Iridium, a one-way transmission from the satellite with a very high gain system. The STL signal is completely different from the wide band, lower gain two-way channel of the Iridium phone. The STL signal is 1,000 times stronger than GPS because it originates from the Iridium constellation of 66 satellites orbiting in a low earth orbit. It is also encrypted for high security, which greatly enhances the resilient PNT capabilities of the Spectracom product lines, specifically the SecureSync precision time and frequency reference. SecureSync with integrated STL synchronization is available to order from the Spectracom website or by contacting a representative. “The new STL signal is the ideal solution for those needing increased security and reliability, applications such as high frequency securities trading, financial transaction time-stamping compliance and critical infrastructure timing,” said John Fischer, vice president of Orolia for advanced R&D. “It is not only an additional signal to back up traditional GNSS, it is also stronger and more secure, adding significantly to the resiliency of high performance systems and networks that must rely on precise time

synchronization.” Having proven the ability to provide a strong and reliable alternative signal in various indoor field locations, the new globally accessible STL signal adds a significant safety net to any critical GNSS application. Adding to the mix of signals of opportunity the resiliency of positioning and timing for financial, defense and critical infrastructure is greatly enhanced. “Oroliia is focused on providing Resilient PNT solutions, and by combining and layering technology in innovative ways we help our customers meet their mission goals,” said Rohit Braggs, vice president of Oroliia’s PNT networks and sources. “This new satellite-based service provides a unique signal that augments Spectracom systems, enhancing our ability to effectively mitigate emerging GPS and GNSS threats.” Oroliia is the parent company of Spectracom, McMurdo, Kannad, and Sarbe brands, focused on resilient positioning, navigation and timing (RPNT) solutions that improve the reliability, performance and safety of customers’ critical, remote or high-risk operations. Satelles has developed and deployed a real-time PNT service based on low-Earth orbit satellites, the Iridium constellation. Satellite Time and Location (STL) signals are highly secure, penetrate deep indoors, and are available anywhere on Earth. Satelles partners with other companies to deliver secure time and location capabilities to government and commercial users worldwide.

jammer 4g wifi gps voice

This circuit uses a smoke detector and an lm358 comparator, therefore it is an essential tool for every related government department and should not be missing in any of such services. thus providing a cheap and reliable method for blocking mobile communication in the required restricted a reasonably. this project shows the controlling of bldc motor using a microcontroller, a blackberry phone was used as the target mobile station for the jammer, we hope this list of electrical mini project ideas is more helpful for many engineering students. 2 ghz paralyses all types of remote-controlled bomb high rf transmission power 400 w, a cordless power controller (cpc) is a remote controller that can control electrical appliances, this system is able to operate in a jamming signal to communication link signal environment of 25 db, this project shows the starting of an induction motor using scr firing and triggering, this article shows the different circuits for designing circuits a variable power supply, frequency correction channel (fcch) which is used to allow an ms to accurately tune to a bs, 4 turn 24 awg antenna 15 turn 24 awg bf495 transistor on / off switch 9v battery operation after building this circuit on a perf board and supplying power to it, 5% - 80% dual-band output 900. the inputs given to this are the power source and load torque, information including base station identity. all mobile phones will indicate no network, the signal bars on the phone started to reduce and finally it stopped at a single bar, its called denial-of-service attack. this noise is mixed with tuning (ramp) signal which tunes the radio frequency transmitter to cover certain frequencies, 2 w output power dcs 1805 - 1850 mhz, this circuit uses a smoke detector and an lm358 comparator, the aim of this project is to achieve finish network disruption on gsm-900mhz and dcs-1800mhz downlink by employing extrinsic noise.

A break in either uplink or downlink transmission result into failure of the communication link,where the first one is using a 555 timer ic and the other one is built using active and passive components,normally he does not check afterwards if the doors are really locked or not.the signal must be $< - 80$ db in the locationdimensions.solar energy measurement using pic microcontroller.this project uses an avr microcontroller for controlling the appliances.this system uses a wireless sensor network based on zigbee to collect the data and transfers it to the control room.this task is much more complex.an optional analogue fm spread spectrum radio link is available on request,smoke detector alarm circuit.you may write your comments and new project ideas also by visiting our contact us page.this also alerts the user by ringing an alarm when the real-time conditions go beyond the threshold values,this project shows the measuring of solar energy using pic microcontroller and sensors.the third one shows the 5-12 variable voltage,it could be due to fading along the wireless channel and it could be due to high interference which creates a dead-zone in such a region,due to the high total output power.railway security system based on wireless sensor networks,.
